George A. Anastassiou

Ordinary and Fractional Approximation by Non-additive Integrals: Choquet, Shilkret and Sugeno Integral Approximators

Series: Studies in Systems, Decision and Control

- Presents a range of original approaches to approximation
- All chapters are self-contained and can be read independently
- Provides a deeper formal analysis of several issues that are relevant to decision making, complex processes, systems modeling and control, and related areas
- Is suitable as a textbook for related graduate classes
- Obtains results that are sure to find application in many areas of pure and applied mathematics, especially in approximation theory, numerical analysis and mathematical economics (both ordinary and fractional)

Ordinary and fractional approximations by non-additive integrals, especially by integral approximators of Choquet, Shilkret and Sugeno types, are a new trend in approximation theory. These integrals are only subadditive and only the first two are positive linear, and they produce very fast and flexible approximations based on limited data. The author presents both the univariate and multivariate cases. The involved set functions are much weaker forms of the Lebesgue measure and they were conceived to fulfill the needs of economic theory and other applied sciences. The approaches presented here are original, and all chapters are self-contained and can be read independently.
